Opening a New Shopping Mall in Mumbai, Maharashtra

By: Arohi Narang

Data

To solve the problem, we will need the following data:

- List of neighbourhoods in Mumbai. This defines the scope of this project which is confined to the city of Mumbai, the financial capital city of the country of India.
- Latitude and longitude coordinates of those neighbourhoods. This is required in order to plot the map and also to get the venue data.
- Venue data, particularly data related to shopping malls. We will use this data to perform clustering on the neighbourhoods.

Sources of data and methods to extract them

This Wikipedia page(https://en.wikipedia.org/wiki/Category:Suburbs_in_Mumbai) contains a list of 42 neighbourhoods in Mumbai. We use web scraping techniques to extract the data from the Wikipedia page, with the help of Python requests and beautiful soup packages. Then we get the geographical coordinates of the neighbourhoods using Python Geocoder package which will gives us the latitude and longitude coordinates of the neighbourhoods.

After that, we use Foursquare API to get the venue data for those neighbourhoods.

Foursquare has one of the largest database of 105+ million places and is used by over 125,000 developers.

Foursquare API will provides many categories of the venue data. We are particularly interested in the Shopping Mall category in order to help us to solve the business problem put forward. This is a project that will make use of many data science skills, from web scraping (Wikipedia), working with API (Foursquare), data cleaning, data wrangling, to machine learning (K-means clustering) and map visualization (Folium). In the next section, we will present the Methodology section where we will discuss the steps taken in this project, the data analysis that we did and the machine learning technique that was used.
